

Accessibility Statement

How DoseRX approaches digital accessibility for the marketing website and the operational product used by Irish EMS and care providers.

Version 1.0

6 August 2026

Local policy document

DoseRX is committed to making its digital services usable by as many people as reasonably practicable, including people who use assistive technologies, keyboard-only navigation, or who benefit from clear layout, readable typography, and sufficient colour contrast.

Commitment: We aim to conform to **WCAG 2.2 Level AA** for the public marketing website and to apply the same principles, as far as practicable, to the DoseRX application used for medicines and controlled-drug operational control. This statement describes our approach, measures, known limitations, and how to request help or report a barrier.

1. Scope

Surface	URL / context	Covered
Marketing website	https://www.doserx.ie	Public information pages, contact form, policy documents
DoseRX application	Client-hosted / demo environments (e.g. dose-rx-one.vercel.app)	Login, bag & stock workflows, witnessing, audits, management views
Third-party content	Linked HSE / partner PDFs, external apps & maps	Outside DoseRX control; linked for reference only

2. Standards & legal context

DoseRX designs and iterates with reference to:

- **WCAG 2.2** — Web Content Accessibility Guidelines, Level **AA** target.
- **EN 301 549** — European accessibility requirements for ICT (aligned with WCAG).
- **European Accessibility Act (EAA)** — relevant product and service accessibility expectations for digital offerings placed on the EU market.
- **Irish equality and disability frameworks** — including duties under Irish equality law and public-sector digital accessibility expectations where DoseRX is supplied into HSE / publicly funded pathways.

This document is a **supplier accessibility statement**. Formal conformance claims for a specific client deployment remain subject to that deployment's configuration, content, and any controller-mandated

customisations.

3. Measures we take

Structure & semantics

Logical heading order, labelled form controls, meaningful link text, and landmarks where the stack supports them — so screen readers and keyboard users can navigate predictably.

Keyboard & focus

Primary flows are intended to work without a pointing device. Visible focus states and operable controls are design requirements for new UI work.

Perception

Text alternatives for informative images on the website; contrast-conscious colour choices; information not conveyed by colour alone where operational status must be understood.

Product UX

Clear labels for stock actions, witnesses, and bag models; busy / loading states communicated in text where overlays are used; consistent shell navigation across phone, tablet, and desktop.

3.1 Website-specific practices

- Skip-friendly section structure with in-page anchors for Architecture, Security, Product, Features, Partners, Policies, and Contact.
- Contact form fields are labelled; topic routing is selectable without relying solely on colour.
- Policy PDFs are provided as downloadable / viewable sources so requirements can be reviewed offline or with assistive PDF tooling.

3.2 Application-specific practices

- Role-based screens keep primary actions prominent to reduce cognitive load under time pressure.
- Critical controlled-drug steps (e.g. dual PIN witnessing) use explicit prompts rather than colour-only cues.
- Responsive layouts support phone, tablet, and laptop use in ambulance, control, and office settings.

4. Conformance status

Honest status: The DoseRX marketing website and application are under active improvement toward WCAG 2.2 AA. We *do not* claim a completed formal third-party audit for every screen at the date of this statement. Known or emerging gaps are tracked and prioritised for remediation.

Area	Status (v1.0)	Notes
Marketing website (doserx.ie)	Partially conformant — improving	Core pages designed for readability and keyboard use; residual gaps may remain in motion, focus order edge cases, or older assets
DoseRX application	Partially conformant — improving	Operational UI prioritises speed and safety; some dense tables, scanners, or overlays may need further assistive-tech hardening

Area	Status (v1.0)	Notes
PDF policy documents	Accessible where tooling allows	Text-based PDFs preferred; complex layout PDFs should still be readable with common screen-reader PDF support

5. Known limitations & workarounds

- **Camera / QR scanning** — barcode and QR capture depends on device camera APIs; users who cannot use a camera can enter codes or identifiers manually where the workflow provides a keyboard path.
- **Real-time overlays** — busy indicators and modal confirmations may need further live-region announcements for some screen readers; raise a barrier report if a step is silent.
- **Charts / analytics** — visual charts may lack equivalent data tables in every view; request a tabular export or alternative format via support.
- **Third-party embeds & external PDFs** — accessibility of linked HSE or partner materials is the responsibility of those publishers.
- **Older browsers / OS** — modern evergreen browsers are supported; very old assistive technology combinations may not be fully tested.

6. Feedback & contact

If you encounter an accessibility barrier on the website or in the DoseRX product, please tell us. We aim to acknowledge requests promptly and provide a workable alternative where a fix cannot be shipped immediately.

Channel	Address	Use for
General / commercial	contact@doserx.ie	Procurement questions, accessibility commitments in tenders
Support	support@doserx.ie	Barrier reports, workarounds, user assistance
Product / engineering	devteam@doserx.ie	Technical remediation, WCAG defect detail

When reporting a barrier, please include: the page or screen, what you were trying to do, the assistive technology or browser (if known), and whether the issue blocks the task completely.

7. Assessment approach

- Manual review of key journeys (login, bag open / close, stock adjust, witness, contact form).
- Automated checks during development where available (linting / browser tools).
- Prioritisation of issues that block clinical or operational task completion.
- Client feedback during pilots incorporated into the remediation backlog.

8. Preparation of this statement

This statement was prepared by the DoseRX supplier for local use with Irish EMS and care-provider clients. It will be reviewed at least annually, or sooner after a material redesign of the website or application.

9. Policy statements (plain language)

1. DoseRX intends its website and product to be **usable with keyboard and assistive technologies**, aiming at **WCAG 2.2 Level AA**.
2. We publish this statement so clients and users can see our **commitment, scope, and honest conformance status**.
3. We do **not** claim a completed full third-party audit of every screen at v1.0; gaps are tracked and fixed as a priority.
4. Users can **report barriers** to support@doserx.ie (or contact@ / devteam@ as appropriate) and expect a response with a workaround or fix path.
5. Linked third-party documents and services are **outside DoseRX's control** for accessibility.

IMPORTANT This document is a supplier accessibility statement for DoseRX. It does not replace a client's own public-sector accessibility statement (where required), a formal WCAG audit certificate, or legal advice. Conformance of a live deployment depends on configuration, content, and browser/assistive-technology combinations in use.
